

Migration of Moore to AlgTools

Niels van Eldik

Moore data flow

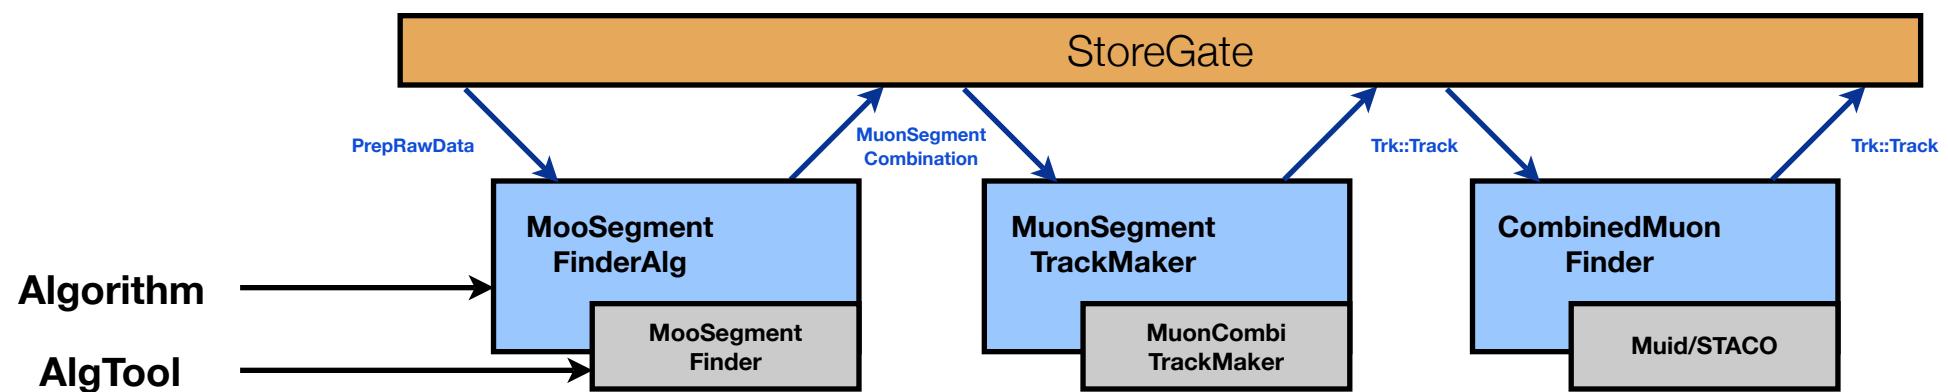

Evaluating the design

- Old Moore design Algorithm based
- Problems old design
 - Algorithms cannot be used in the event filter
 - TrigMoore duplicated part of the Moore code
 - potential source of bugs
 - trigger not always in sink with offline version
- Solution: move algorithmic code into AlgTools
 - Algorithms purely access and pass around data
 - scheme already successfully used by the Inner Detector

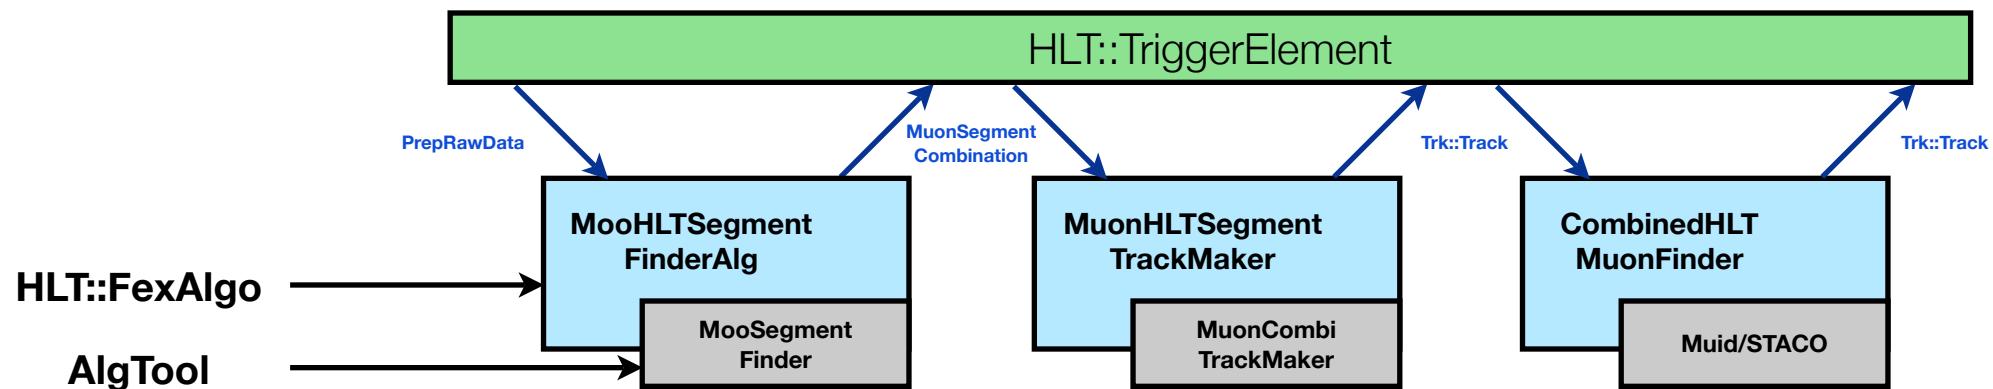

Proposal new design

Offline

Online

Status of migration

- Prototypes for Segment and Track finding available for testing
 - `MooSegmentFinder (AlgTool)` + `MooSegmentFinderAlg (Algorithm)`
 - `MuonCombiTrackMaker (AlgTool)` + `MuonSegmentTrackMaker (Algorithm)`
- Code can be found under `~neldik/public/MooreAlgTools.tgz`
 - thanks to Ed and Woochun for they help!
 - not all code in CVS yet
 - final version expected by the end of this week

Open questions

- StoreGate access to ‘PrepRaw’Data from Tools ok for trigger?
 - use-case for direct SG access from tools
 - segment recovery needs to access data for a give chamber/region crossed by a track
 - used by both track finder and Muid
 - calorimeter data from Muid
 - if not ok, need new technical solution to propagate seeding to sub tools.
 - possible solution: provide data access tool
 - `const MdtPrepDataCollection* getData(const Identifier& id) const`
 - all data access via tool(s)
- How do we keep track of associations between objects during the reconstruction
 - Association tools?
